

**Barriers to Managing Private Wells and Septic Systems in Underserved Communities:
Mental Models of Homeowner Decision Making**

Supporting Information

Contents:

1. Figure S1. Expert model of private well water systems
2. Figure S2. Expert model of private septic systems
3. Figure S3. Frequency with which private well system expert codes were mentioned by interviewees
4. Figure S4. Frequency with which private septic system expert codes were mentioned by interviewees
5. References

Figure S1. Expert model of private well water systems. Topics relevant to managing private water well systems were gathered from a literature review (Benham & Ling, 2013; NC Department of Health and Human Services, 2015; United States Environmental Protection Agency, 2015a,b; Virginia Cooperative Extension, n.d.; Water Systems Council, n.d.; National Environmental Services Center, 2004). Topics were arranged to illustrate how water well systems function and how these systems should be monitored and maintained. This diagram was reviewed by a private well expert for accuracy and completeness.

Figure S2. Expert model of private septic systems. Topics relevant to managing private septic systems were gathered from a literature review (Benham & Ling, 2013; NC Department of Health and Human Services, 2015; United Stat

Figure S3. Frequency with which private well system expert codes were mentioned by interviewees (n=18). Numbers within each diagram node represent the number of interviewee mentions, regardless of interview statement accuracy. Thicker lines represent nodes that were mentioned by a higher number of interviewees. Counts were measured by first assigning each diagram node a code. These codes were then assigned to individual transcript statements when relevant.

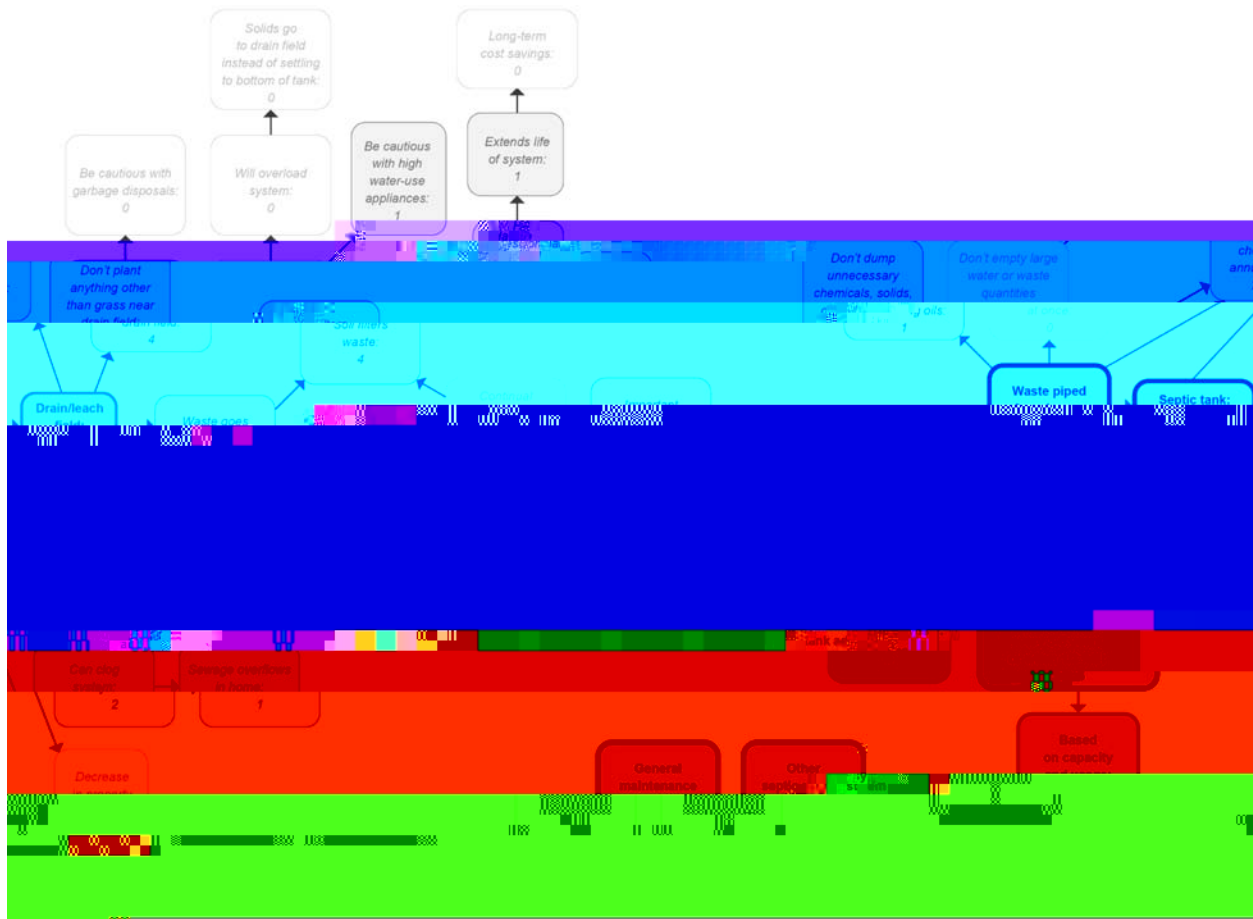

Figure S4. Frequency with which private septic system expert codes were mentioned by interviewees (n=18). Numbers within each diagram node represent the number of interviewee mentions, regardless of interview statement accuracy. Thicker lines represent nodes that were mentioned by a higher number of interviewees. Counts were measured by first assigning each diagram node a code. These codes were then assigned to individual transcript statements when relevant.
